In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This speptide is derived from the human desmoglein 3 protein (amino acids 251-265) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein protein are described in W04841-47.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fused protein recognised by pemphigus vulgaris auto:antibody - useful to treat and diagnose pemphis vulgaris Claim 1; Page 7-9; 9pp; Japanese.
W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgGl hinge region and the resulting fusion protein is useful to treat or diagnose

PT Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat pr pc5 - involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell scale of the protocadherins. This cc sequence represents the human protocadherin pc3. These sequences are crelated to cadherin, and possess cell adhesive ability. Cadherins are composed of an N-terminal extracellular domain cadhesion. Cadherins are composed of an N-terminal extracellular domain consists of 5 unique subdomains, a membrane spanning domain, and a c-terminal cytoplasmic domain. The cytoplasmic domain interacts with the cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. The sequences were isolated using primers I and 2 (see T03575 and consisted properties. Antibodies produced against these sequences are useful for modulating the binding activity of these cc protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Propendition foliaceus antigen-IgG constant region fusion protein - linked protein 1: Page 10-12; 17pp; Japanese.

Claim 1: Page 10-12; 17pp; Japanese.

CThis sequence represents a fused protein recognised by pemphigus foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus foliaceus antigen protein through the hinge portion. Pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar ct dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is cspecially administered through an adsorbent upon which the fusion protein is immobilised via a carrier. The fusion protein is also useful for detecting pemphigus foliaceus antibodies which is useful in immunodiagnosis. The fusion protein has little or no side effects. Sequence 778 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                            through, the gastrointestinal tract, e.g. insulin or leuprolide Disclosure; Fig 2; 294pp; English.

This sequence is the human HPT-1 protein. The invention relates to purified proteins (I) that bind specifically to at least one of th gastro-intestinal (GI) tract receptors human intestinal peptide-associated transporter (HPT1), hPEPT1, D2H and human sucrose-isomaltase complex (hSI). (I) provide active transport of therapeutic agents through human and animal GI tissue (into the bloom in vivo delivery, particularly for treatment or prevention
                                                                                                                                                                                                                                                                            of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer, migraine, or angina pectoris. Specifically they are used to deliver insulin or leuprolide, but many other suitable therapeutic agents are disclosed, including genes or inhibitory nucleic acid, imaging agents and antigens. (I) may also provide targeting to the GI tract. Other uses of (I) are: (1) to determine the level of specified receptors in a sample (in a binding assay); and (11) to screen for molecules that bind (I): "Immunogenic analogues or derivatives of (I) are used to raise antibodies and in immunoassays. The antibodies are used to locate, detect and measure (I), e.g. for imaging, monitoring treatment, tissue analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gastro-intestinal transport receptor; binding protein; hSI; HPT1; D2H; hPEPT1; human; GI tract receptor; sucrose-isomaltase complex; intestinal peptide-associated transporter; hypertension; diabetes; osteoporosis; haemophilia; anaemia; cancer; migraine; angina pectoris;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New proteins that bind specifically to receptors in the gastro-intestinal tract and related nucleic acid - chantibodies, used to deliver therapeutic or diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human HPT-1 protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              04-MAY-1999 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cherapeutic agent delivery; therapy; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  331

CC C-terminus of the fourth extracellular subdomain (EC-4) were CC designed for use as PCR primers. PCR was carried out on a rat brain CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CC The 450 bp band corresponded to the expected length between the two CC primer sites, but the 130 bp band could not be predicted from any CC primer sites, but the 130 bp band could not be predicted from any CC clones were extracted and sequenced. Nineteen novel partial cDNA CC clones (including sequences corresp. to the PCR primers) are given CC clones (including sequences corresp. to the PCR primers) are given CC clones were isolated. The DNA and deduced AA sequences of the CC clones were isolated at S8860-R58878. The deduced AA sequences of the CC clones were isolated to the pCR primers) are given CC clones (including sequences corresp. to the PCR primers) are given CC cadherins. The cadherins described thus far have highly conserved CC D-Y-E or D-E-F located at the middle region of the subdomain and CC the consensus sequence in R58879 or R58800 at its end, while the CC corresp. sequences of other subdomains, except for the 5th extra-CC cellular subdomain (EC-5), are D-R-E and the sequence in R58881 cc clones that corresp. to cadherin extracellular subdomains include the sequence D-Y-E or D-F-E at one end, but have the sequence CC D-Y-N-D-N-X-P-X-F instead of R58879 or R58880 at the other end. CC chass appear to comprise a new subclass of cadherin-related collars to comprise a new subclass of cadherin-related

PT New isolated vascular endothelial cadherin-2 - used to develop products for modulating angiogenesis, e.g. for treating tumours, proglaucoma, psoriasis, inflammatory diseases or organ transplantation program is provided by the sequence is that of protocadherin-4 (pcdh-4), or as it may call the sequence is that of protocadherin-2. As a vascular endothelial cadherin it promotes cell-to-cell homotypic adhesion and its cadherin it promotes cell-to-cell homotypic adhesion and its capression is upregulated in proliferating endothelial cells in comparison to resting cells. It can be used for inhibiting cappeners and inhibiting pathological conditions such as tumours, angiogenesis and inhibiting pathological conditions such as tumours, can discovered in the pathological conditions such as tumours, and soriasis. It may also be used for the prevention or inhibition of cell eukocyte infiltration, tumour cell metastasis, or endothelial permeability, as a vaccine and for making endothelial junctions more permeable to antigens, thus indicating use of the modifiers for treatment or prevention of acute and chronic inflammatory diseases, or organ transplantation, myocardial ischaemia, atherosclerosis, rheumatoid carthritis and intestinal infection. It may also be used for detection, sequence 1180 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 1; Page 40; 146pp; English.

CC 887102-887120 represent partial fragments of the rat protocadherin CC sequence. The CDNAs encoding these sequences were isolated after CC screening a rat brain cDNA preparation with the primers shown in T03575 CC and T03576. The primers were constructed from portions of the amino acid CC sequences of the third and fourth extracellular domains of published CC catherin sequences. The full length cDNA sequence encoding rat CC catherin sequences with the cytoskeleton through catenins and other CC catherin interacts with the cytoskeleton through catenins and other CC catherins adherins, but in those which possess it, it is essential for the CC catherins adhesive function. The catherins which do not possess a CC cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in CC cell-cell as the cell-cell adhesive properties. Antibodies produced CC call, as well as the cell-cell adhesive properties. Antibodies produced CC these protocatherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Dr Polynuclotide sequences encoding new proto:cadherins - useful proto: modulating natural binding and regulating activities. PS Example; Page 44; 114pp; English.

CC Two regions of conserved AA sequence, one from the middle of the CC third cadherin extracellular subdomain (EC-3) and the other from the CC third cadherin extracellular subdomain (EC-4) were CC designed for use as PCR primers. PCR was carried out on a rat brain CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. Two major bands of about 450 bps and 130 bps were found. CDNA prepn. The collect and sequences. The 450 bp and 130 CD bp bands were extracted and sequenced. Nineteen novel partial cDNA CC clones (including sequences corresp. to the PCR primers) are given CC clones (including sequences corresp. to the PCR primers) are given CC consensus sequence in R58870. The deduced AA sequences of the corresp. Sequences in the EC-3 including the consensus sequence CC corresp. Sequences of cher subdomains, except for the Sth extracellular subdomain subdomain and the CC-3) are D-R-E and the sequence in R5881 CC sequence D-Y-E or D-F-E at one end, but have the sequence CC the sequence D-Y-E or D-F-E at one end, but have the sequence CC the sequence D-Y-E or D-F-E at one end, but have the sequence CC DNAs appear to comprise a new subclass of cadherin-related CC DNAs appear to comprise a new subclass of cadherin-related CC DNAs appear to comprise a new subclass of cadherin-related CC DNAs and the consensus sequence and consensus sequence

PS Example 1; Page 47; 146pp; English.

CC R87102-R87120 represent partial fragments of the rat protocadherin
CC sequence. The cDNAs encoding these sequences were isolated after
CC screening a rat brain cDNA preparation with the primers shown in T03575
CC screening a rat brain cDNA preparation with the primers shown in T03575
CC cand T03576. The primers were constructed from portions of the amino acid
CC cadherin sequences. The full length cDNA sequence encoding rat
CC coadherin sequences. The full length cDNA sequence encoding rat
CC coadherin interacts with the cytoskeleton through catenins and other
CC cytoskeleton associated proteins. The cytoplasmic domain of
CC cytoplasmic domain appear to function via a different method from those
CC with a cytoplasmic domain appear to function via a different method from those
CC with a cytoplasmic domain. These protein sequences are involved in
CC cell, as well as the cell-cell adhesive properties. Antibodies produced
CC against these sequences are useful for modulating the binding activity of
CC these protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

 Claim 5; Columns 75-78; 59pp; English.
The present sequence is full length human cadherin-5, which is a Ca2+ dependent cell adhesion protein. The human cadherin was isolated from a placental cDNA library, using probes based
                                                                                                                                                                                                                                                                                                                             W13130 standard; Protein; W13130; 13-MAY-1997 (first entry)

                                                                                                      50
                                                                                                                            Human and rat cadherin polypeptide(s) - mediate cell-cell adhesion
claim 1; Column 69-72; 56pp; English.
This sequence represents human cadherin-5. The invention specifically
provides details of human cadherin-5, -8, -11, -12 and -13, and rat
cadherin-8, -5, -11 and -13. Cadherins are calcium-dependent cell
adhesion proteins. They are glycosylated integral membrane proteins
that have an N-terminal extracellular domain that determines binding
specificity, a hydrophobic membrane spanning region and a C-terminal
cytoplasmic domain, which is highly conserved among members of the
superfamily. The C-terminal domain interacts with the cytoskeleton
through eatenins and other cytoskeleton-associated proteins. The
novel cadherin proteins may be used in the analysis of the role of
cadherins in various cancers. Sequence analysis of the cadherin
cadherin. The cadherin proteins may be isolated by using anti-cadherin
cadherin and to determine the tissue specific distribution of cadherin
proteins. Each subclass of cadherins has a unique tissue distribution

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 on homologous rat cadherin cDNA.
Antibodies or fragments that specifically bind the human cadherin can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

Example 2; Columns 85-90; S9pp; English.

The present sequence is full length human cadherin-8, which is a Ca2+ dependent cell adhesion protein. The human cadherin cDNA us isolated from a foetal brain cDNA library, using probes based on homologous rat cadherin cDNA.

Antibodies or fragments that specifically bind the human cadherin can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

Sequence 793 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 1; Columns 49-52; 59pp; English.

The present sequence is full length rat cadherin-8, which is a Ca2+ dependent cell adhesion protein. The rat cadherin cDNA was isolated from a brain cDNA library using a labelled rat cadherin-8 extracellular domain PCR fragment as a probe. The rat cDNA was then used to isolate the cDNA encoding its full length human homologue from a human foetal brain cDNA library.

Antibodies or fragments that specifically bind the human cadherin can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

R30742;
   rused protein recognised by pemphigus vulgaris auto:antibody useful to treat and diagnose pemphis vulgaris Claim 1; Page 7-9; 9pp; Japanese.

NOT908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human 1gGl hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N-PSDB; Q35992.

DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure; Fig 7; 50pp; English.

This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.

Rat CRF2-beta receptor.
CRF2-beta receptor; corticotropin-releasing
cerebrovascular disorder; memory disorder; A
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse corricotropin releasing factor receptor mCRF-RB1 was identified as the product of a cDNA clone (T28972) isolated fromouse heart library. Recombinant mCRF-RB1 can be expressed in host cells transformed by the cDNA clone. The receptor can be to identify agonists and antagonists that modulate the signal transduction activity mediated by CRF receptors. It may be administered therapeutically to reduce high ACTH levels caused

Page 63-66; 109pp; English.

Rat corticotropin releasing factor-2-beta (CRF2-beta) receptor (R90575) is a membrane-bound G-coupled protein receptor involve in signal transduction. It can be produced by expression of
                                                                                                                                                                                               encoding cDNA (T12244) in procaryotic or eucaryotic host cells. Recombinant CRF2 receptor is used to screen CRF2 receptor agonists and antagonists of therapeutic appln., and to prepare antibodies which specifically bind to CRF2 receptors.

Kaposi's sarcoma associated herpes virus (KSHV) clone KS5 (T16806)

Cobtd. from a KS lesion genomic library, includes 15 complete ORFs 2 incomplete ORFs (T16807-23) named according to their herpesvirus caimiri positional homologues. The ORF32 (T16802) product is given in R93616. KSHV proteins and peptides may be obtd. by incorporating encoding sequences into a vector and expression in concorporating encoding sequences into a vector and expression in construct or therapeutic value.

Sequence 454 AA;

Claim 2; Page 38-40; 54pp; French.
An enzyme which degrades high mol. wt. N-acetylheparosan into fragments of lower mol. wt. We consider the same pharmaceutical starting materials) can be obtained from E.coli (K5) SEBR 3282. The DNA sequence (Q86268) coding for the enzyme was isolated in a plasmid (p838.7) which has been deposited in E.coli RRI strain as CNCM I-1352. The deduced amino acid sequence (R71802) has homology with an exo-poly-alpha-D-galacturonidasse from Erwinia chrysanthemi sequence 820 AA;

Protein from Haemonchus contortus and other nematodes -
therapeutic and prophylactic agent to protect plants, an
therapeutic and prophylactic agent to protect plants, an
humans from parasitic nematode infection.

Disclosure; Fig 49; 209pp; English.

The proteins derived from the nematode DNA may be used t
vaccines against parasitic infection of plants, humans a
esp. sheep. MAbs may also be raised to provide passive t
prophylaxis against infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein from Haemonchus contortus and other nematodes - therapeutic and prophylactic agent to protect plants, a humans from parasitic nematode infection.

Disclosure; Fig 49; 209p; English.

The proteins derived from the nematode DNA may be used vaccines against parasitic infection of plants, humans esp. sheep. MAbs may also be raised to provide passive prophylaxis against infection.
                                                                                                                                                                                                          Hog cholera virus genome product.

CC This is a truncated BLM protein encoded by a mutant gene sequence isolated from a Japanese Bloom's Syndrome sufferer designated "97(AsoK)". The deletion of CAA from positions 631-633 of the CC wild-type gene results in a stop codon at amino acid position 186. This was one of the seven unique mutantions which were identified in a study of 10 people with Bloom's Syndrome. Based on the various mutations, diagnostic tests for Bloom's Syndrome have been developed which use standard sequence analysis techniques to detect the presence of 2 mutated BLM genes or the absence of a wild-type BLM gene.

CC Note: The present sequence does not appear in the specification; it has been made by modifying the H1-5' wild type BLM sequence which is provided in Figure 2 (W15264).

Diagnosing Bloom's syndrome, and carriers, by detecting mutant BLM genes - for gene therapy with nucleic acid encoding active BLM genes - for gene therapy with nucleic acid encoding active BLM protein to treat Bloom's syndrome and cancer in general Disclosure; Page -; 51pp; English.

This is a truncated BLM protein encoded by a mutant gene sequence isolated from a German Bloom's Syndrome sufferer designated "112(NaSch) The substitution of the base A at the position 888 of the wild type H1. gene to the base T results in a stop codon at amno acid position 272. This was one of the seven unique mutations which were identified in a study of 10 people with Bloom's Syndrome. Based on the various
                                                                                                                                                                                                                                                                                                                                                                                                            Bloom's syndrome BLM mutated protein.

                                                                                                                                                               This is a truncated BLM protein encoded by a mutant gene sequence isolated from a Japanese Bloom's Syndrome sufferer designated "93(YoYa)". The insertion of a bp A at the position 1610 in the wild type H1-5' BLM gene results in the insertion of a novel codon for Lysine after amino acid position 514 followed by a stop codon.

This was one of the seven unique mutations which were identified in a study of 10 people with Bloom's Syndrome. Based on the various mutations, diagnostic tests for Bloom's Syndrome have been developed which use standard sequence analysis techniques to detect the presence of 2 mutated BLM genes or the absence of a wild-type BLM gene of Note: The present sequence does not appear in the specification; it has been made by modifying the H1-5' wild type BLM sequence which is provided in Figure 2 (W15264).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mutations, diagnostic tests for Bloom's Syndrome have been developed which use standard sequence analysis techniques to detect the presence of 2 mutated BLM genes or the absence of a wild-type BLM gene. Note: The present sequence does not appear in the specification; it has been made by modifying the HI-5' wild type BLM sequence which is provided in Figure 2 (WI5264).

FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME INVOLVED IN THE INTERACTION OF PLAQUE PROTEINS FILAMENTS MEDIATING CELL-CELL ADMESION.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: EPIDERMIS, TONGUE, TONSIL,
                                                                                                                                                                                                                                                                                                                                                                                                    DISEASE: PEMPHIGUS VULGARIS (PV) IS A POTENTIALLY LETHAL SKIN DISEASE IN WHICH EPIDERWAL BLISTERS OCCUR AS THE RESULT OF THE LOSS OF CELL-CELL ADHESION CAUSED BY THE ACTION OF AUTOANTIBODIES AGAINST DSG3.
                                                                                                                                                                                                                                                                                                                                                                                 SIMILARITY: BELONGS TO THE CADHERIN FAMILY. DESMOSOMAL SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CARCINOMAS.

Virology 188:926-930(1992).
-i- FUNCTION: PROBABLE COMPONENT OF THE ACTIVE POLYMERASE.
FUNCTION IN MRNA SYNTHESIS, CAPPING, METHYLATION AND POSTEIN KINASE ACTIVITY.
SYNTHESIS OF NEWLY SYNTHESIZED VIRAL MRNAS, RNA EDITING GENE TRANSCRIPT, AND PROTEIN KINASE ACTIVITY.
-i- SIMILARITY: WITH L PROTEIN OF OTHER PARAMYXOVIRUSES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the European Bioinformatics Institute. "Identification of a novel murine receptor for corticotropin-releasing hormone expressed in the heart."; MOL. Endocrinol. 9:637-645(1995).

**NOL. ENDOCTION: THIS IS A RECEPTOR FOR CORTICOTROPIN RELEASING SHOWS HIGH-APFINITY CRF BINDING. THE ACTIVITY OF THIS RECEPTOR FOR CORTICOTROPIN RECEASE.

**SHOWS HIGH-APFINITY CRF BINDING. THE ACTIVITY CYCLASE.**

**MEDIATED BY G PROTEINS WHICH ACTIVATE ADENYLYL CYCLASE.**

**INDICATED BY G. PROTEINS WHICH ACTIVATE ADENYLYL CYCLASE.**

**INDICATED BY G. PROTEINS HIGHLY EXPRESSED IN THE HEART. ALSO E IN LUNGS, SKELETAL MUSCLE, GASTROINTESTINAL TRACT, EPIDID IN LUNGS, SKELETAL MUSCLE, GASTROINTESTINAL TRACT, EPIDID IN LUNGS, SKELETAL MUSCLE, GASTROINTESTINAL TRACT.

J. Cell Biol. 13:1007-1015(1995).

-i. FUNCTION: IMPLICATED IN THE CONTROL OF CELL GROWTH.

-i. CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +
PROTEIN TYROSINE PHOSPHATE.

-i. SUBUNIT: ASSOCIATES THROUGH ITS SH3 DOMAIN, TO THE P8:
PHOSPHATIDYLINOSITOL 3-KINASE.

-i. SIMILARITY: CONTAINS 1 SH2 DOMAIN.

-i. SIMILARITY: CONTAINS 1 SH2 DOMAIN.

-i. SIMILARITY: CONTAINS 1 SH2 DOMAIN.

-i. SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE COMMAIN.

BELONGS TO THE SRC SUBFAMILY.
